

World of Promptcraft

A fantasy multiplayer world where the game loop, world state, and LangGraph-driven NPCs all reinforce one another.

- **A world first.** The project already reads as a game, not as a chatbot demo.
- **Agents with consequences.** NPCs can reason, remember, and act inside shared state.
- **A strong fit for LLMday.** It shows what agent design looks like when embedded in a real runtime.

What the player actually does

IDENTITY

Create a character

The experience starts with MMO-style identity: faction, race, appearance, and character fantasy.

EXPLORATION

Move through a living realm

The player traverses zones, settlements, dungeons, interfaces, and atmosphere systems built on the 3D client.

INTERACTION

Talk, trade, quest, fight, build

Core play comes from interacting with NPCs, progressing quests, handling combat, and shaping the world.

SHORT EXPLANATION FOR THE AUDIENCE

This is a world-based game loop: identity creates roleplay, exploration creates context, and interaction creates the need for believable agents.

Why a fantasy world is a strong fit for agentic NPCs

WHY THE SETTING WORKS

- Fantasy worlds naturally contain merchants, guards, quest givers, druids, and rivals with clear roles
- Persistent towns and factions make relationships and memory feel meaningful
- Magic, weather, rituals, and world events make tool-driven behavior legible to players

WHY THE SIMULATION WORKS

- Manifest-driven zones give the world structure instead of one flat map
- Server authority gives every action a single source of truth
- World builder systems let both players and agents change the environment

SPEAKER LINE

"This world makes sense because the fiction, the mechanics, and the agent model all ask for the same thing: persistent characters inside a shared realm."

The world is data-driven and visually authored in code

MANIFEST ZONES

The world is described as structured zones instead of one hardcoded map, which makes it extensible.

PROCEDURAL LOOK

- Materials, structures, and silhouettes come from in-repo generators
- The world feels authored even though much of the visual language is procedural

The architecture behind the world

CLIENT LAYER

Three.js game runtime

Terrain, atmosphere, movement, collision, dungeons, combat UI, quests, and world builder tools all live in the client.

SERVER LAYER

FastAPI + WebSockets + WorldState

The server handles connections, nearby broadcasts, cleanup, and authoritative state mutation.

AGENT LAYER

LangGraph per NPC

The agent system injects personality, context, memory, and tools into each non-player character.

ONE-LINE ARCHITECTURE SUMMARY

The client makes the world feel alive, the server makes it consistent, and the agent layer makes the NPCs feel intentional.

The NPC loop is deeper than prompt and reply

01

Pre-check

Fast routing handles simple or out-of-band turns before expensive reasoning.

02

Reason

The model sees persona, goal, player state, world context, recent chat, and lore.

03

Act

Tool calls emit pending actions instead of mutating the world directly.

04

Reflect

The NPC updates internal state so the next encounter feels continuous.

WHY THIS MATTERS

This is what turns a model call into a believable world character rather than a stateless answer box.

Memory gives continuity, tools give consequence

PERSISTENT MEMORY

conversation_summary

episodic_memories

mood

relationship_score

current_goal

The NPC can remember gifts, grudges, promises, and its own next intention.

TOOL FAMILIES

combat

dialogue

trade

environment

world query

quest

Tools write to a pending-action sink, then the server applies them through authoritative state.

Where this sits relative to the state of the art

A COMMON AI NPC DEMO

- Interesting dialogue but shallow simulation grounding
- Little or no memory beyond recent chat
- No authoritative world model behind the conversation

WHAT THE FRONTIER IS MOVING TOWARD

- Persistent memory and identity over many interactions
- Tool use, planning, and bounded world actions
- Embodied agents inside shared simulated environments

WHY WORLD OF PROMPTCRAFT MATTERS

It is a strong state-of-the-art direction because it combines memory, tools, server authority, and a coherent 3D world instead of treating AI as a detached conversation surface.

World of Promptcraft is compelling because the game design, the architecture, and the agent model all point in the same direction.

- **The game works.** The player has a real loop: explore, interact, progress, and build.
- **The architecture works.** Client, server, and agents each have a clear responsibility.
- **The world makes sense.** Persistent characters and world logic support the agent fiction naturally.

World

where AI is one of the native systems
